APPLICANT(S) FOR DO/EO/US

Michel DEVIC

Applicant herewith submits to the United States Designated/ Elected Office (DO/EO/US) the following items under 35 U.S.C. 371:

1. ☒ This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. ☐ This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
3. ☒ This is an express request to begin national examination procedures (35 U.S.C. 371(f)) at any time rather than delay examination until the expiration of the applicable time limit set in 35 U.S.C. 371(b) and PCT Articles 22 and 39(1).
4. ☒ A proper Demand for International Preliminary Examination was made by the 19th month from the earliest claimed priority date.
5. ☒ A copy of the International Application as filed (35 U.S.C. 371(c)(2))
 - a. ☐ is transmitted herewith (required only if not transmitted by the international Bureau).
 - b. ☒ has been transmitted by the International Bureau.
 - c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US)
6. ☒ A translation of the International Application into English (35 U.S.C. 371(c)(2)).
7. ☐ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371(c)(3))
 - a. ☐ are transmitted herewith (required only if not transmitted by the International Bureau).
 - b. ☐ have been transmitted by the International Bureaus.
 - c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
 - d. ☒ have not been made and will not be made.
8. ☐ A translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 37(c)(3)).
9. ☐ An oath or declaration of the inventor(s) (35 U.S.C. 371(c)(4)).
10. ☐ A translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371(c)(5)).

Items 11. to 16. below concern document(s) or information included:

11. ☒ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
12. ☐ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
13. ☒ A **FIRST** preliminary amendment.
☐ A **SECOND** or **SUBSEQUENT** preliminary amendment.
14. ☐ A substitute specification.
15. ☐ A change of power of attorney and/or address letter.
16. ☒ Other items or information:

A copy of the International Application Publication WO 01/05498
 A copy of the Preliminary Examination Report
 A copy of Form PCT/IB/306

PRELIMINARY AMENDMENT

Assistant Commissioner for Patents
Washington, D.C. 20231

Sir:

Applicant respectfully requests entry of the following amendment and remarks into the file of the above-identified application.

IN THE CLAIMS:

Please cancel claims 1-16 without prejudice.

Please add new claims as follow:

17. (New) A device comprising a cylindrical vertical reactor having a bottom and a top, wherein the reactor comprises:

means for injecting gaseous reactants, said injection means is disposed at the bottom;

means for discharging gas, said discharging means is disposed at the top; and a plurality of centrifugal turbines arranged along a vertical agitating shaft.

18. (New) The device of claim 17, wherein the centrifugal turbines are arranged regularly along a single vertical shaft.

19. (New) The device of claim 17, wherein the reactor further comprises counter-baffles.

20. (New) The device of claim 17, wherein the reactor further comprises a heat exchanger.

21. (New) The device of claim 17, wherein the height of the reactor is between about 1.5 and about 10 times the diameter of the reactor.

22. (New) The device of claim 21, wherein the height of the reactor is between about 2 and about 4 times the diameter.

23. (New) The device of claim 17, wherein the turbines are radial.

24. (New) The device of claim 17, wherein the turbines are flanged.

25. (New) The device of claim 17, wherein the turbines have one or more central openings.

26. (New) The device of claim 17, wherein the number of the turbines is between 2 and 20.

27. (New) The device of claim 26, wherein the number of the turbines is between 3 and 8.

28. (New) The device of claim 17, wherein the diameter of the turbines is between about 0.2 to about 0.5 times the diameter of the reactor.

29. (New) The device of claim 17, wherein the thickness of the turbines is between about 0.07 and about 0.25 times the diameter of the turbines.

30. (New) The device of claim 17, the turbines comprise vanes, which the vanes are arranged in helix, at an angle or in radial.

31. (New) The device of claim 17, which further comprises a continuous gaseous phase and a liquid phase comprising suspended solid catalysts and many small bubbles of gaseous reactants, wherein the continuous gaseous phase occupies upper part of the reactor, and the liquid phase occupies lower part of the reactor.

32. (New) The device of claim 31, wherein the continuous gaseous phase represents from about 10 to about 30 % of the volume of the reactor.

33. (New) The device of claim 32, wherein the continuous gaseous phase represents from about 20 to about 25 % of the volume of the reactor.

34. (New) The device of claim 31, wherein the turbines are immersed in the liquid phase when agitation stops.

35. (New) The device of claim 17, wherein the reactor comprises at least one filter.

36. (New) The device of claim 35, wherein the filter is inside or outside the reactor.

37. (New) A process including a reaction step using gaseous reactant in the presence of a solid catalyst, which comprises stirring the gaseous reactant and a liquid phase containing the solid suspended catalyst so that the gaseous reactant reaches the bottom of the reactor of claim 17.

38. (New) A process for preparing an aqueous solution of hydrogen peroxide starting from hydrogen and from oxygen, which comprises:

injecting hydrogen and oxygen into a reactor of claim 17 which contains a liquid phase containing a solid suspended catalyst and

stirring the liquid phase so that hydrogen and oxygen reach the bottom of the reactor of claim 17.

REMARKS

Claims 17-38 are pending in the present application. Claims 1-16 has been canceled. Original claims have been re-written to new claims to avoid potential formality problems. Hence, support for the newly added claim can be found in the specification, *inter alia*, in originally filed claims. No new matter is believed to be introduced.

No fee is believed due for the filing of this response. Should any fees be required, however, please charge such fees to Pennie & Edmonds LLP Deposit Account No. 16-1150.

Respectfully submitted,

Date: December 7, 2001

WO 01/05498

1

PCT/FR00/01416

MULTILEVEL REACTOR, ITS USES, AND PROCESS FORMANUFACTURING HYDROGEN PEROXIDE

The present invention relates to a process in which gaseous components are reacted in the presence of
5 a solid suspended in a liquid phase. The invention also relates to a device for implementing the process. More particularly, the invention relates to a device and a process for manufacturing hydrogen peroxide directly from oxygen and hydrogen, with a catalyst suspended in
10 an aqueous phase.

Patent applications WO 96/05138 and WO 92/04277 disclose that hydrogen and oxygen can be reacted in a tubular reactor (pipeline reactor) in which there is high-speed circulation of an aqueous
15 reaction medium comprising a suspended catalyst. Hydrogen and oxygen are thus dispersed in the reaction medium in proportions exceeding the limit for flammability of hydrogen, i.e. giving a molar concentration ratio of hydrogen to oxygen greater than
20 0.0416 (Enclopédie des Gaz [Gas Encyclopedia] - Air Liquide, page 909). A process of this type is safe only if hydrogen and oxygen remain in the form of small bubbles. Furthermore, to obtain a reasonable conversion of the gaseous reactants, the length of the tubular
25 reactor has to be considerable and has to comprise a large number of bends. Under these conditions it is difficult to ensure that no gas pocket forms. In addition, any stoppage of the circulation of the

10018594-012002

aqueous reaction medium can cause an explosive continuous gaseous phase to appear.

European patent application EP 579 109 discloses that hydrogen and oxygen can be reacted in a

5 "trickle bed" reactor filled with solid particles of catalyst through which the aqueous reaction medium and the gaseous phase containing hydrogen and oxygen can be made to flow cocurrently. Again, it is very difficult to ensure that a process of this type is safe, due to

10 the risk that part of the trickle bed may dry out and to the difficulty of dissipating the considerable amounts of heat generated by the reaction.

The patents US 4009252, US 4279883, US 4681751 and US 4772458, furthermore, disclose a

15 process for the direct manufacture of hydrogen peroxide, in which hydrogen and oxygen are reacted in a stirred reactor in the presence of a catalyst suspended in an aqueous reaction medium. However, the use of a stirred reactor has the disadvantage of leading to

20 either a low conversion rate or inadequate productivity.

The literature generally indicates that complete operational safety requires that productivity be sacrificed, and that inversely an increase in

25 productivity for hydrogen peroxide is obtained at the expense of safety.

10016594.042302

The subject of the present invention is therefore the provision of a process comprising a reaction step using gaseous components in the presence of a solid suspended in a liquid phase, and in

- 5 particular a process for the direct manufacture of hydrogen peroxide in complete safety and with optimized productivity for hydrogen peroxide, and a device capable of implementing the same.

- The device of the invention comprises a
- 10 cylindrical vertical stirred reactor provided with means of injection of gaseous reactants at the bottom, with means of discharge at the top for removing the gaseous reactants, and with centrifugal turbines arranged, preferably regularly, along a single vertical
- 15 agitating shaft. The vertical shaft is generally driven by a geared motor unit which is most often situated either above or below the reactor. Depending on the length of the shaft, it may be supported by one or more bearings.

- 20 The reactor may also be equipped with counter-baffles and/or with a heat exchanger.

- The perfectly stirred reactor consists of a single space without any fixed horizontal partitions. The height of the reactor is generally between 1.5 and
- 25 10 times the diameter and preferably between 2 and 4 times the diameter. The reactor is also provided with

10018594.042502

a bottom and with a lid which can be flat or hemispherical.

Figure 1 is a simplified diagram of a particular device of the invention.

5 The device comprises a vertical stirred reactor (V) provided with centrifugal turbines (a) arranged along an agitating shaft driven by a motor (M). The reactor is also equipped with counter-baffles (c) and with a heat exchanger (R). Means of injection
10 (1, 2) of gaseous reactants are provided at the bottom of the reactor, and a discharge (3) situated at the top of the reactor serves for evacuation of gaseous reactants.

Any type of centrifugal turbine capable of
15 drawing a mixture of liquid, of bubbles of gas, and of suspended solid to the central axis of the reactor and of projecting this mixture radially in a horizontal plane in order to provide circulation of liquid mixture, bubbles of gas, and solid in accordance with
20 figure 1 can be suitable according to the invention.

Preference is given to flanged radial turbines with one or two central openings. Flanged turbines similar to those used for centrifugal water pumps with the pumping orifice directed downward are
25 very particularly suitable.

1001854-04200
2024-12-10

The turbines may be equipped with vanes arranged radially or at an angle or forming helices. The number of vanes is preferably between 3 and 24.

The number of turbines depends on the ratio of the height of the reactor to the diameter of the reactor and is generally between 2 and 20, preferably between 3 and 8.

The distance between two turbines is preferably between 0.5 and 1.5 times the external diameter of the turbine; this latter is preferably between 0.2 and 0.5 times the diameter of the reactor.

The thickness of the turbines is preferably between 0.07 and 0.25 times the diameter of the turbine. Thickness means the distance between the two flanges of the turbine.

The device according to the invention may also comprise a filter installed inside or outside the reactor.

In operation, the lower part of the reactor is occupied by a liquid phase comprising suspended solid catalysts and many small bubbles of gaseous reactants, while the upper part is occupied by a continuous gaseous phase. The volume occupied by the continuous gaseous phase represents between 10 and 30% of the total volume of the reactor and preferably between 20 and 25%.

The turbines are arranged along the agitating shaft so that they are immersed, and preferably completely immersed, in the liquid phase when agitation stops.

- 5 The speed of rotation of the turbine is chosen so as both to maximize the number of possible bubbles of gas per unit of volume of the liquid phase and minimize the diameter of the bubbles.

- 10 To prevent the entire liquid phase from rotating, the reactor is equipped with counter-baffles, preferably consisting of vertical rectangular plates arranged around the turbines. The counter-baffles are generally situated between the cylindrical wall of the reactor and the turbines.

- 15 The height of these metal plates is generally close to that of the cylindrical part of the reactor. The width is generally between 0.05 and 0.2 times the diameter of the reactor.

- 20 The number of counter-baffles selected is determined as a function of their width and is generally between 3 and 24 and preferably between 4 and 8.

- 25 The counter-baffles (c) are preferably placed vertically at a distance of between 1 and 10 mm from the wall (p) of the reactor and oriented on the axis of radii coming from the center of the reactor, as shown in figure 2, which is a cross section of the reactor

equipped with a particular turbine with (o) representing the suction orifice of the turbine, (f) the flange of the turbine, and (u) the vane of the turbine.

5 Some or all of the counter-baffles may be replaced by a heat exchanger. The exchanger preferably consists of a bundle of vertical cylindrical tubes whose height is close to or equal to that of the cylindrical part of the reactor.

10 These tubes (t) are generally arranged vertically around the turbines in accordance with figure 2.

 The number and diameter of these tubes are determined in such a way as to maintain the temperature
15 of the liquid phase within the desired limits. The number of tubes is often between 8 and 64.

 Although the device according to the invention may be used for implementing a reaction at atmospheric pressure, it is most often preferable to
20 operate under pressure. High pressures of the order of from 10 to 80 bar are advantageously selected to accelerate the reaction rate.

 The reactor, the means of agitation, and the exchangers may consist of any material usual in the
25 chemical industry, such as stainless steels (304 L or 316 L).

10018594.042902

10018594.04502

A protective coating of a polymer, such as PVDF (vinylidene polyfluoride), PTFE (polytetrafluoroethylene), PFA (copolymer of C_2F_4 and perfluorinated vinyl ether), or FEP (copolymer of C_2F_4 and C_3F_6) may be applied to all of the internal surfaces of the reactor, and external surfaces of the means of agitation and exchangers. It is also possible to restrict the coating to certain elements subject to abrasion, for example the turbines.

10 The device is very particularly suitable for the direct manufacture of hydrogen peroxide, with hydrogen and oxygen injected in the form of small bubbles of diameter lower than 3 mm and preferably between 0.5 and 2 mm, into the aqueous liquid phase, 15 preferably with molar flow rates such that the ratio of molar flow rate of hydrogen to that of oxygen is greater than 0.0416, while the content of hydrogen in the continuous gaseous phase is maintained below the flammability limit.

20 The catalysts generally used are those described in US patent 4772458. These are solid catalysts based on palladium and/or platinum, optionally supported on silica, alumina, carbon, or aluminosilicates.

25 Besides suspended catalysts, the aqueous phase, acidified by addition of a mineral acid, may comprise stabilizers for hydrogen peroxide and

decomposition inhibitors, for example halides. Bromide is particularly preferred and is advantageously used in combination with free bromine (Br_2).

- The invention also provides the process
- 5 comprising a reaction step using gaseous components in the presence of a solid suspended in a liquid phase. This process consists in introducing the gaseous components (2 or more) at the bottom of the reactor either separately or in the form of a mixture.
- 10 Introduction in the form of a mixture is preferred when the composition of the gaseous mixture is compatible with safety requirements. In this case the feeding of reactants may take place by way of a duct housed in the agitating shaft and then by way of a set of small
- 15 orifices in the center of the turbine situated at the bottom of the reactor, in such a way as to produce a large number of small bubbles in the liquid flux ejected by the turbine.

- When the process requires feeding of the
- 20 gaseous components in proportions which create risk of fire or of explosion, the gaseous reactants are introduced separately into the reactor either by injection by way of discrete pipes situated upstream of the lowest suction orifice of the turbine, or by way of
- 25 discrete fritted tubes situated immediately below the lowest turbine.

The device of the present invention may operate continuously or semicontinuously.

In semicontinuous mode, the gaseous reactants are introduced continuously during a defined time into
5 the lower part of the reactor, occupied by a liquid phase comprising the suspended solid catalyst.

Excess gaseous reactants reaching the continuous gaseous phase of the reactor are generally evacuated continuously by maintaining a constant
10 prevailing pressure inside the reactor. At the end of the defined time, the reactor is discharged to recover the products of the reaction.

When operation is continuous, the gaseous reactants and the reaction solution are introduced
15 continuously into the reactor, initially charged with solid catalyst suspended in the reaction solution constituting the liquid phase. Excess gaseous reactants are evacuated continuously, and the products of the reaction are continuously decanted by way of continuous
20 withdrawal of the liquid phase through one or more filters in such a way as to keep the solid catalysts suspended inside the reactor.

The filter(s) may be of candle-filter type made of fritted metal or of ceramic material, the
25 filters preferably being placed vertically in the reactor alongside the vertical cooling tubes or the counter-baffles.

The filters may also be placed outside the reactor and in this case preferably consist of a hollow porous tube, made of metal or of ceramic material, inside which the liquid phase from the reactor, comprising the suspended catalyst, circulates in a closed circuit. A device comprising a filter outside the reactor is illustrated by figure No. 3. The hollow tube (g) is arranged vertically and is fed at its base with the liquid phase withdrawn at the bottom of the reactor, and the liquid phase collected at the top of the tube is returned to the upper part of the reactor. This continuous circulation may be brought about by a pump or else by local pressure increases created by the agitating turbines of the reactor.

- 15 In accordance with a preferred device of the invention, represented in figure No. 3, the clear liquid phase after removal of catalyst is collected in a jacket (h) placed around the porous hollow tube, and then evacuated by way of a control valve (6) in such a way as to maintain a constant level of liquid phase in the reactor. Reaction solution is continuously pumped into the reactor with a flow rate calculated to maintain a chosen value for the concentration of the product of the reaction, soluble in the liquid phase.
- 20 Some of the reaction solution may advantageously be injected progressively into the jacket (h) by way of the duct 7, to unblock the filter. The reaction

solution may also be sprayed at high pressure for a continuous cleaning of the continuous gaseous phase in the reactor.

The gaseous reactants are introduced continuously into the bottom (b) of the reactor by way of routes 1 and 2, and those which have not reacted may be recycled by way of route 4.

In the case of direct synthesis of hydrogen peroxide, a selected flow rate of hydrogen is injected via (1) into the liquid phase, below the bottom turbine (b). A selected flow rate of oxygen comprising a low proportion of hydrogen is withdrawn (4) into the continuous gaseous phase in the reactor and injected into the liquid phase via (2), below the bottom turbine (b). A flow rate of fresh oxygen (5) is injected into the continuous gas phase in the reactor to compensate for the oxygen consumed and also to keep the continuous gaseous phase outside flammability limits. A pressure regulator (release valve) allows excess gaseous reactants (3) and inert gases which are possibly present in the fresh oxygen, for example nitrogen, to be evacuated from the continuous gaseous phase in the reactor.

An advantage of the device of the invention in the event that stirring stops accidentally is that it allows all of the bubbles of the gaseous reactants

1001854.042502

to rise and directly arrive at the continuous gaseous phase solely under the action of gravitational forces.

EXPERIMENTAL SECTION (examples)

Device for the direct synthesis of an aqueous

5 solution of hydrogen peroxide

The reactor, of capacity 1 500 cm³, consists of a cylindrical vessel 200 mm in height and 98 mm in diameter.

The bottom and the lid are flat.

10 A removable PTFE sleeve of thickness 1.5 mm is placed into the interior of the reactor.

Agitation is provided by a vertical stainless steel axle of length 180 mm and of diameter 8 mm, driven by a magnetic coupling placed on the lid of the
15 reactor.

One, two or three flanged turbines of external diameter 45 mm, thickness 9 mm (between the two flanges) provided with a suction orifice of diameter 12.7 mm, oriented downward, and with 8 flat
20 radial vanes of width 9 mm, length 15 mm, and thickness 1.5 mm may be fixed to the agitating shaft at various selected heights in such a way as to divide the liquid phase into substantially equal volume.

The bottom turbine is placed 32 mm from the
25 bottom, the second turbine 78 mm from the bottom, and the third 125 mm from the bottom.

10018594.042902

Four counter-baffles of height 190 mm, width 10 mm, and thickness 1 mm, are placed vertically in the vessel, perpendicularly to the inner wall of the reactor, and held 1 mm from this wall by two centering
5 rings.

The cooling or heating is provided by eight vertical tubes of diameter 6.35 mm and length 150 mm, arranged in a ring 35 mm from the axis of the vessel.

A stream of water at a constant temperature
10 flows through this coil.

Hydrogen and oxygen are injected into the liquid phase by means of two discrete stainless pipes of diameter 1.58 mm, conducting the gases to the center of the bottom turbine. The injection of the gaseous
15 reactants into the aqueous medium, and that of the oxygen into the continuous gaseous phase, are controlled with the aid of mass flow meters. In certain experiments carried out, oxygen was replaced by a mixture of oxygen and nitrogen in various proportions.

20 The pressure prevailing inside the reactor is kept constant by a release valve.

In-line gas-phase chromatography is used to determine the amounts of hydrogen, oxygen, and optionally nitrogen constituting the gaseous flux being
25 discharged from the reactor.

10016594.042502

Catalyst preparation

The catalyst used comprises 0.7% by weight of palladium metal and 0.03% by weight of platinum supported on microporous silica.

- 5 It is prepared by impregnating the silica (Aldrich Ref. 28,851-9) with the following characteristics:

| | | |
|----|-------------------------|-------------------------------|
| | - Average particle size | = from 5 to 15 μm |
| | - BET surface area | = 500 m^2/g |
| 10 | - Pore volume | = 0.75 cm^3/g |
| | - Average pore diameter | = 60 \AA |

with an aqueous solution comprising PdCl_2 and H_2PtCl_6 , and then drying, and finally heat treatment under hydrogen at 300°C for 3 hours.

- 15 The catalyst is then suspended (10 g/l) in a solution comprising 60 mg of NaBr, 5 mg of Br_2 and 12 g of H_3PO_4 , the solution being heated at 40°C for 5 hours, and the catalyst is then filtered, washed with demineralized water, and dried.

20 Aqueous reaction medium

An aqueous solution is prepared by adding 12 g of H_3PO_4 , 58 mg of NaBr, and 5 mg of Br_2 to 1 000 cm^3 of demineralized water.

General operating specification

- 25 The selected volume of aqueous reaction medium is introduced into the autoclave, and then the calculated quantity of catalyst is added. The autoclave

10018594-042902

is pressurized by injecting oxygen at a selected flow rate into the continuous gaseous phase. The pressure remains constant due to the pressure regulator. The liquid medium is brought to the selected temperature by
5 circulating temperature-controlled water within the bundle of cooling tubes.

The agitation is controlled to 1 900 rpm, and oxygen and hydrogen are injected at the selected flow rates to the center of the bottom turbine.

10 The flow rate of, and the hydrogen content in, the gaseous mixture coming out of the pressure regulator are measured.

After 1 hour of reaction, the inflow of hydrogen and oxygen into the aqueous reaction medium is
15 shut down, and the injection of oxygen into the continuous gaseous phase is maintained until all of the hydrogen in this latter has disappeared. The inflow of oxygen is then shut down, and the reactor is then depressurized, and finally the aqueous solution of
20 hydrogen peroxide is recovered.

Once recovered, the aqueous solution of hydrogen peroxide is weighed, and then separated from the catalyst by filtration over a Millipore® filter.

The resultant solution is then subjected to
25 iodometric analysis, which allows the concentration of hydrogen peroxide to be calculated. The selectivity of the synthesis is defined as the percentage obtained

10018594-04500
206240-4-6581001

when the number of moles of hydrogen peroxide formed is divided by the number of moles of hydrogen consumed.

The conversion rate is defined as the percentage obtained when the volume of hydrogen consumed is divided by the volume of hydrogen introduced.

The conditions of operation and the results obtained during the various experiments are presented in the table below.

10 For examples 2, 3, 7, 8, 9 and 14 operations are carried out with the two bottom turbines.

10016594.042302

TABLE (for 1 hour of reaction)

| Example | Number of turbine in reactor | Amount of catalyst (g) | Initial volume of aqueous solution (cm ³) | Flow rate of H ₂ into the bottom turbine (NL/h) | Flow rate of O ₂ injected into the bottom turbine (NL/h) | Flow rate of N ₂ injected with O ₂ into the bottom turbine (NL/h) | Flow rate of O ₂ injected into the continuous gaseous phase (NL/h) | Pressure in the reactor (bar) | Temperature in the reactor (°C) | Concentration of H ₂ in the continuous gaseous phase in the reactor (%) | Concentration of H ₂ O ₂ in the aqueous solution obtained (%) | Hydrogen conversion rate (%) | Reaction selectivity based on hydrogen (%) |
|---------|------------------------------|------------------------|---|--|---|---|---|-------------------------------|---------------------------------|--|---|------------------------------|--|
| 1 | 1 | 6 | 430 | 120 | 240 | 0 | 2 640 | 50 | 40 | 2.5 | 12.5 | 36 | 91 |
| 2 | 2 | 6 | 700 | 120 | 240 | 0 | 2 640 | 50 | 41 | 1.4 | 12.2 | 60 | 90 |
| 3 | 2 | 9 | 700 | 120 | 240 | 0 | 2 640 | 50 | 41 | 1.4 | 12.2 | 60.8 | 89 |
| 4 | 3 | 8.5 | 1 000 | 120 | 240 | 0 | 2 640 | 50 | 40 | 0.95 | 10.6 | 73 | 90 |
| 5 | 3 | 8.5 | 1 000 | 120 | 240 | 0 | 2 640 | 60 | 40 | 0.87 | 10.8 | 76 | 89 |
| 6 | 3 | 8.5 | 1 000 | 120 | 240 | 0 | 2 640 | 60 | 60 | 0.5 | 11.0 | 82 | 84 |
| 7 | 2 | 6 | 700 | 25 | 335 | 0 | 265 | 50 | 39 | 2.1 | 2.3 | 45 | 97 |
| 8 | 2 | 6 | 700 | 80 | 280 | 0 | 1 640 | 50 | 40 | 1.8 | 8.1 | 53 | 96 |
| 9 | 2 | 6 | 700 | 100 | 260 | 0 | 2 140 | 50 | 40 | 1.6 | 10.2 | 57 | 92 |
| 10 | 3 | 8.5 | 1 000 | 120 | 216 | 24 | 2 640 | 50 | 40 | 0.95 | 10.5 | 73 | 89 |
| 11 | 3 | 8.5 | 1 000 | 120 | 240 | 60 | 2 580 | 50 | 40 | 1.13 | 10.0 | 68 | 90 |
| 12 | 3 | 8.5 | 1 000 | 120 | 120 | 480 | 1 980 | 50 | 40 | 1.83 | 6.3 | 55 | 70 |
| 13 | 3 | 8.5 | 1 000 | 100 | 130 | 520 | 1 400 | 50 | 40 | 2.07 | 5.7 | 50.4 | 80 |
| 14 | 2 | 6 | 700 | 140 | 220 | 0 | 3 140 | 50 | 40 | 1.43 | 13.8 | 61 | 87 |
| 15 | 3 | 8.5 | 1 000 | 140 | 220 | 0 | 3 140 | 50 | 40 | 0.82 | 12.2 | 74 | 89 |

Examples 1, 2, 3 and 4 show, for identical conditions of temperature, pressure, and H_2/O_2 ratio, that increasing the number of radial turbines allows the conversion rate to be increased just as efficiently as by combining a number of reactors in a cascade.

This is because, if τ_1 denotes the conversion rate of one level (reactor with 1 turbine), τ_2 denotes the overall conversion rate of the reactor with 2 turbines, and τ_3 denotes the conversion rate of the reactor with 3 turbines, the rule for calculating conversion in stirred reactors installed in a cascade is indeed found to apply:

$$(1-\tau_2) = (1-\tau_1)(1-\tau_1) \text{ and}$$

$$(1-\tau_3) = (1-\tau_1)(1-\tau_1)(1-\tau_1)$$

Using this relationship it is possible to extrapolate the number of turbines necessary to obtain the high conversion rate sought by the invention.

Examples 7, 8 and 9 show, for one reactor and identical reaction conditions, that the conversion rate and the content of H_2O_2 in the solution after 1 hour of reaction increases markedly with the concentration of hydrogen in the gaseous mixture introduced into the liquid phase.

Examples 5 and 6 show that it is possible with the reactor according to the invention to obtain a conversion rate of 80% with only 3 turbines, with

productivity exceeding 100 kg of H_2O_2 per hour and per useful m^3 in a reactor, with very high selectivity.

- Examples 10 and 11 show that using the reactor according to the invention it is possible to
- 5 obtain high conversion rates and concentrations of H_2O_2 if use is made of a mixture of oxygen and nitrogen (from 10% to 20%) instead of pure oxygen.

The use of air (example 12 and 13) again gives interesting results.

- 10 Examples 14 and 15 also show, with a different H_2/O_2 ratio, that moving from 2 turbines to 3 turbines allows the hydrogen conversion rate to be increased and the concentration of H_2 to be reduced in the continuous gaseous phase in the reactor.

CLAIMS

1. A device comprising a cylindrical vertical stirred reactor provided with means of injection of gaseous reactants at the bottom, with
5 means of gaseous discharge at the top and, optionally, equipped with counter-baffles and/or a heat exchanger, characterized in that the reactor is provided with centrifugal turbines arranged, preferably regularly, along a single vertical agitating shaft.
- 10 2. The device as claimed in claim 1, characterized in that the height of the reactor is between 1.5 and 10 times the diameter and preferably between 2 and 4 times the diameter.
- 15 3. The device as claimed in claim 1 or 2, characterized in that the turbines are radial.
4. The device as claimed in claim 3, characterized in that the turbines are flanged.
5. The device as claimed in claim 4, characterized in that the turbines have one or two
20 central openings.
6. The device as claimed in any one of claims 1 to 5, characterized in that the number of turbines is between 2 and 20, and preferably between 3 and 8.
- 25 7. The device as claimed in any one of claims 1 to 6, characterized in that the external diameter of the turbines is between 0.2 and 0.5 times the diameter of the reactor.

10018594-07900
200210-1458001

8. The device as claimed in any one of claims 1 to 7, characterized in that the thickness of the turbines is between 0.07 and 0.25 times the diameter of the turbines.

5 9. The device as claimed in any one of claims 1 to 8, characterized in that the turbines are equipped with vanes forming helices or at an angle or arranged radially.

10 10. The device as claimed in one of claims 1 to 9, characterized in that, during operation, the lower part of the reactor is occupied by a liquid phase comprising suspended solid catalysts and many small bubbles of gaseous reactants, and the upper part is occupied by a continuous gaseous phase.

15 11. The device as claimed in claim 10, characterized in that the continuous gaseous phase represents from 10 to 30% of the volume of the reactor and preferably from 20 to 25%.

20 12. The device as claimed in claim 10 or 11, characterized in that the turbines are immersed, and preferably completely immersed, in the liquid phase when agitation stops.

25 13. The device as claimed in one of claims 1 to 12, characterized in that the reactor is provided with one or more filters.

10018594.042902

14. The device as claimed in claim 13, characterized in that the filter(s) is inside or outside the reactor.

15. A process comprising a reaction step
5 using gaseous reactants in the presence of a solid suspended in a liquid phase, characterized in that the gaseous reactants reach the bottom of the reactor of the device as claimed in any of claims 1 to 14.

16. A process for preparing an aqueous
10 solution of hydrogen peroxide starting from hydrogen and from oxygen, characterized in that use is made of a device as claimed in any of claims 1 to 14.

(54) Title: MULTISTAGE REACTOR, USES AND METHOD FOR MAKING HYDROGEN PEROXIDE

(54) Titre: REACTEUR MULTITAGE, SES APPLICATIONS ET PROCEDE DE FABRICATION DU PEROXYDE D'HYDRO-
GENE

(57) Abstract: The invention concerns a device comprising a cylindrical vertical stirred reactor (v), provided with centrifugal turbines (a) arranged along a single vertical agitating shaft, and its uses for implementing any process whereby several gas constituents are made to react in the presence of a solid suspended in a liquid phase. The device is particularly suited for directly making hydrogen peroxide.

(57) Abrégé: Dispositif comportant un réacteur agité vertical (v) de forme cylindrique, muni de plusieurs turbines centrifuges (a) disposées le long d'un arbre d'agitation unique vertical, et ses applications dans la mise en oeuvre de tout procédé dans lequel on fait réagir plusieurs composants gazeux en présence d'un solide mis en suspension dans une phase liquide. Le dispositif convient tout particulièrement pour la fabrication directe du peroxyde d'hydrogène.

**DECLARATION FOR NON-PROVISIONAL PATENT APPLICATION***

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below at 201 et seq. beneath my name.

I believe I am the original, first and sole inventor if only one name is listed at 201 below, or an original, first and joint inventor if plural names are listed at 201 et seq. below, of the subject matter which is claimed and for which a patent is sought on the invention entitled

MULTILEVEL REACTOR, ITS USES, AND PROCESS FOR MANUFACTURING HYDROGEN PEROXIDE

and for which a patent application:

☐ is attached hereto and includes amendment(s) filed on *(if applicable)*

☒ was filed in the United States as Application No. 10/018,594

with amendment(s) filed on December 7, 2001

☒ was filed as PCT international Application No. PCT/FR00/01416 on May 25, 2000 and was amended under PCT Article 19 on *(if applicable)*

I hereby state that I have reviewed and understand the contents of the above identified application, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information known to me to be material to patentability as defined in Title 37, Code of Federal Regulations, §1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, §119(a)-(d) of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

| EARLIEST FOREIGN APPLICATION(S), IF ANY, FILED PRIOR TO THE FILING DATE OF THE APPLICATION | | | |
|--|---------|--------------------------------------|---|
| APPLICATION NUMBER | COUNTRY | DATE OF FILING (day, month, year) | PRIORITY CLAIMED |
